

# APEX®

## Produce more attractive mushrooms and maximize profits with Apex

When using Apex, mushroom yields will increase by providing long-term control of sciarid flies that eat away at profitability. It is non-fungitoxic, so while mushrooms are unaffected, the flies aren't. This is because the insect growth regulator (IGR) in Apex breaks their life cycle and reduces the next generation population. It is also approved for application prior to first break to provide protection for the balance of the cropping cycle.

Apex is easy to apply with options to fit all cultural practices, and is compatible with other pesticide and sanitation programs. It is also environmentally sound with no indication of hazard to man, compost or casing, and has no residual tolerance in food commodities.

If higher yields look good to you, contact your Lambert sales representative.

Available in the U.S. as 5E and in Canada as Apex 65% EC.
